Northstar Commerce

Operations Reference / Synthetic Demo

Payments API recovery thresholds

Use these thresholds after an operator-approved recovery. This assistant does not execute infrastructure changes. Confirm the current incident with traces before applying a historical incident resolution.

Metric	Recovery target	Observation window
Payment timeout rate	Below 1%	10 minutes
Connection acquisition p95	Below 200 ms	10 minutes
Checkout success rate	Above 99%	10 minutes

Pool configuration

The configured Payments API connection pool limit is 40 per pod. Increasing it requires an operator capacity review of Ledger Database.

Escalation & evidence

Ownership

Payments Team owns Payments API. Platform Team owns Ledger Database. Commerce Team owns Checkout Service.

Minimum incident evidence

Collect a sanitized correlation ID, error code, deployment version, pool wait histogram, active connection count, and database slow-query evidence. Never include raw access tokens or customer contact information.
